Actor-critic policy (one set of weights shared by all agents)

≈1.1M parameters. The memory ablation swaps only the core: GRUCell(256) vs a 256-unit feed-forward layer.

h_t is per agent; zeroed when info['born'] marks a new agent in the slot.

Grid ÷ 255 on the way in. Network on MPS (~1 ms for 256 agents), world on CPU.
